project : credit card billing payment reminder system
course : Java programming / mini project
Name: jaiakash
rollno: 25bcs119
Department : computer science
mentor/guide : Aravind

INTRODUCTION

- The Credit Card Billing Payment Reminder System helps users pay their credit card bills on time by sending reminders before the due date. It prevents late fees, reduces interest charges, and helps maintain a good credit score. This system makes managing multiple cards easier and improves financial discipline by keeping users informed about their payments.

OBJECTIVE

- The The main objective of the Credit Card Billing Payment Reminder System is to help users pay their credit card bills on time by providing timely reminders. It aims to reduce late fees, avoid penalties, and improve financial discipline. The system also helps users manage multiple credit cards efficiently and maintain a good credit score.Additionally, the system can improve user awareness by sending alerts well in advance and even after the due date if payment is missed. It can be designed to support different types of notifications such as SMS, email, or mobile app alerts. This flexibility ensures that users stay informed at all times, making the system reliable and effective for managing credit card payments.

PROBLEM STATEMENT

- Many credit card users face difficulties in remembering their payment due
- dates, which often leads to late payments, penalties, and increased interest
- charges. Managing multiple credit cards further increases the risk of missing payments. There is a need for an efficient system that can provide timely reminders, organize billing information, and help users make payments on time to avoid financial loss and maintain a good credit score.

SYSTEM REQUIREMENT

- The Credit Card Billing Payment Reminder System requires both
- hardware and software components for smooth operation. The basic
- hardware requirements include a computer or smartphone with
- internet connectivity. The software requirements include an operating system such as Windows or Android, and a programming environment like Java or Python for development. The system should also support a database to store user details, billing information, and payment history. Additionally, it requires notification services such as SMS, email, or mobile app alerts to send reminders to users effectively.

SYSTEM DESIGN

- The Credit Card Billing Payment Reminder System is designed with a
- simple and user-friendly structure to ensure efficient operation. It
- consists of different modules such as user registration, card management, billing details, reminder scheduling, and notification system. The user enters credit card details and billing information, which are stored in a database. The system then tracks due dates and automatically generates reminders before the payment deadline. A notification module sends alerts through SMS, email, or app notifications. The overall design ensures smooth data flow, easy access, and timely reminders for effective bill management.

MODULE DESCRIPTION

- User Registration Module:
- Allows users to create an account and store personal details securely.

  Card Management Module:

  Enables users to add, update, or delete credit card information.

  Billing Details Module:

  Stores billing cycle, due date, and outstanding amount for each card.

  Reminder Scheduling Module:

  Automatically sets reminders based on due dates and user preferences.

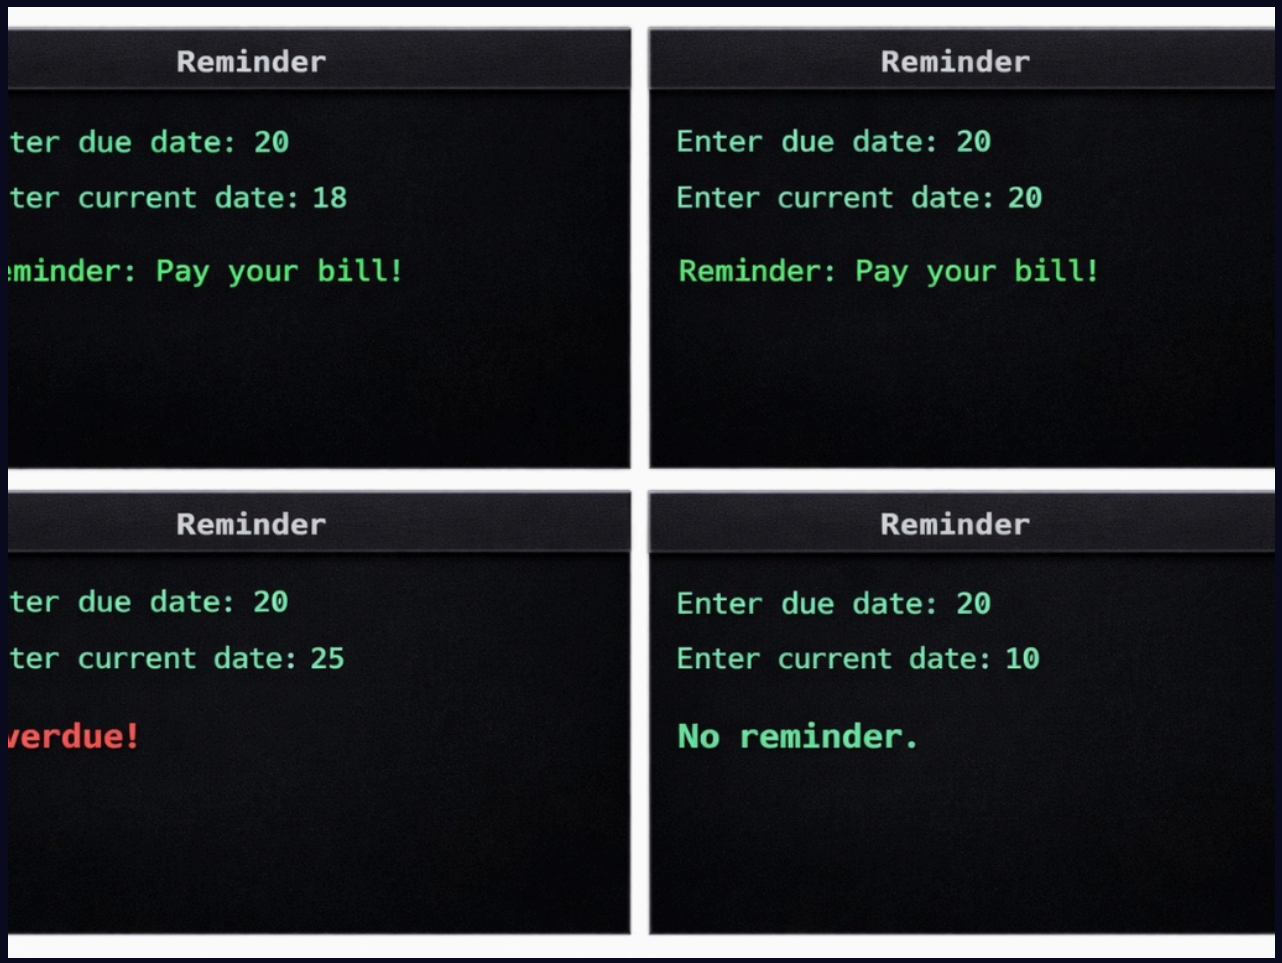
ALGORITHM FLOWCHART

1. start
2. User registers and logs into the system
3. Enter credit card details (due date, amount, etc.)
4. Store the details in the database
5. Check the payment due date
6. If payment is due → Send reminder
7. Update payment status
8. Save payment history
9. Repeat the process for next cycle
10. End

IMPLEMENTATION

- The system is implemented using a simple programming language like Java with
- basic input, processing, and output operations. User details such as name, due date, and bill amount are collected and stored in a database or variables. The system continuously checks the current date against the due date. If the due date is near, it sends a reminder notification; if the payment is overdue, it sends an alert. The system then updates the payment status and stores the history for future reference. This process can be automated to run daily for efficient reminder management.

OUTPUT SCREEN :



CONCLUSION FUTURE EXCHANGEMENT

Conclusion :

- **Helps users pay credit card bills on time and avoid late fees**
- **Provides a simple and reliable system for tracking multiple card payments.**

future exchangement:

1.Integration with banking systems for automatic payments.

2.Development of a mobile app with advanced notification features.

3.Addition of analytics to track spending and give financial suggestions.
